Version v6.00.001

Authoris-e API

The DLL ExpaInt.dll exports the following functions:

GetUserLimits

This will read the Authoris-e Users file (PaUser.dat) and return the Floor and Authorisation limits for the specified user and company. The VB6 declaration is:

```
Declare Function GetUserLimits Lib "ExpaInt.dll" (ByVal CoCode As String, _
                                                ByVal UserCode As String, _
                                                ByRef Floor As Double, _
                                                ByRef Auth As Double) As Integer
```

CoCode is the company code for the required user.
UserCode is the user's code in Authoris-e

If the function is successful then it will return zero and the required values will be returned in Floor and Auth respectively. Any non-zero result indicates failure and should be treated as a Btrieve return code.

GetVersion

This function returns the version number of the dll. The VB6 declaration is:

```
Declare Function GetVersion Lib "ExpaInt.dll" () As PascalString
```

PascalString is declared in MToolDll.bas as

```
Type PascalString
    StrLen As Byte
    Str As String * 255
End Type
```
